Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.

Disclosure; Fig 1; 65pp; English.

This protein sequence is the Rhapanus sativus (radish) mature antifungal protein (Rs-AFP3), which is homologous to proteins AAM19280- AAM19290. Shorter peptides, based on these proteins have been produced (see AAM19291-92, AAM19291-93, AAM19291-304, AAM19301-304, and AAM31765-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease

tolerance of crops, either pre or post harvest. When applied to plants they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct PI field.) 88888888

Protecting plants against pathogens by inducing defensin genes - by stimulating ethylene or jasmonate pathways, also new promoter of defensin gene from Arabidopsis.

Disclosure; Fig 1C; 72pp; English

This sequence represents the radish Rs-AFP3 mature protein domain which is used to explain a novel method for the protection of plants against pathogens which involves inducing expression of a plant defensin gene by stimulating the jasmonate and/or ethylene pathways. The method is used to induce protection against necrotrophic pathogens, specifically fundi and does not require cytotoxic or potentially harmful chemicals

Antimicrobial composition useful for treating microbial diseases in plants, comprises two antimicrobial agents, which are antifungal protein from Radish and Mirabilis of Impatiens.

Disclosure; Page 26; 29pp; English

The present sequence is an antifungal protein from Radish. This protein is useful for treating microbial diseases in plants and for inhibiting microbial growth in foodstuffs. In addition, the present sequence is useful for producing plants with improved resistance to microbial pathogens. The present protein can be used in conjunction with other antimicrobial proteins from Microbials (see AAB49472), and Impatiens (see AAB49474-B49477) to form an antimicrobial composition

```
AW2331-90) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAW36379), Gly9Arg (AAW26376), val39Arg (AAW26377) or Gly9Arg plus val39Arg (AAW26377) or Gly9Arg encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This polypeptide comprises a mutant isoform of radish antifungal protein (RB-AFP2) (see also AAM19616). Novel potent antifungal proteins (see AAW26371-90) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAW26379), GINGNET (AAW26398), GIYAPARG (AAW26376), VA139ARG (AAW26377) or GIY9ARG plus Val39ARG (AAW26378) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to

                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                This polypeptide comprises a mutant isoform of radish antifungal protein 2 (Rs-AFP2) (see also AAM19616). Novel potent antifungal proteins (see AAM2631-90) are based on Rs-AFP2 and contain at least I mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnsMet (see AAW26379), Gly96Met (AAW26380), Gly9Arg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26380) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combaring fungal diseases in agricultural, pharmaceutical or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rs-APP2, radish antifungal protein 2, fungicide, salt tolerance, ( ) preservative, transgenic plant; crop protection.

Novel potent antifungal proteins (see AAW66311-90) are based on Rs-AFP2 and contain at least 1 mutation residue at positions 5 or 16. Proteins containing GlnSMet (see AAW26379), GlySMet (AAW26380), GlySMet (AAW26380), GlySMet (AAW26370), GlySMet (AAW26370), GlySMet (AAW26370), GlySMet (AAW26370), GlySMet (AAW26370), GlySMet (AAW26370) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that combating fungal diseases in agricultural, pharmaceutical or preservative
allow expression of mutant isoforms in yeast as mating factor alpha I fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative applications
                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rs-AFP2; radish antifungal protein 2; fungicide; salt tolerance; preservative; transgenic plant; crop protection.

This polypeptide comprises a mutant isoform of radish antifungal protein 2 (Rs-AFP2) (see also AAW19616). Novel potent antifungal proteins (see AAW26311-96) are based on Rs-AFP2 and contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing GlnSMet (see AAW26379), Gly9Arg (AAW26380), Gly9Arg (AAW26376), Val39Arg (AAW26377) or Gly9Arg plus Val39Arg (AAW26378) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents.

```
Antimicrobial composition useful for treating microbial diseases in plants, comprises two antimicrobial agents, which are antifungal protein from Radish and Mirabilis of Impatiens.
                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is an antifungal protein from Radish. This protein is useful for treating microbial diseases in plants and for inhibiting microbial growth in foodstuffs. In addition, the present sequence is useful for producing plants with improved resistance to microbial pathogens. The present protein can be used in conjunction with other antimicrobial proteins from Mirabilis (see AAB49473), and mimicrobial composition forms an antimicrobial composition
                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 26; 29pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This protein sequence is the Raphanus sativus (radish) mature antifungal protein (Rs-AFP4), which is homologous to proteins AAM19280- AAM19290. Shorter peptides, based on these proteins have been produced (see AAM19291-92, AAM19294-98, AAM19301-304, AAM193030-34 and AAM31765-834). Plants containing DNA sequences encoding these proteins have improved control fungion to bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, the peptide may be used to improve disease resistance or disease they may also have curative as well as protective actions. The peptides may also be used to protect plants by introducing them, or a microorgable of expressing the peptide into the soil. (Updated

This polypeptide comprises radish antifungal protein 2 (Rs-AFP2). Novel potent antifungal proceins (see AAW26371-90) based on Rs-AFP2 contain at least 1 mutation selected from a basic residue at positions 9 or 39, and a hydrophobic residue at positions 5 or 16. Proteins containing Gln5Met (see AAW26379), Gly16Met (AAW26300), Gly2Arg (AAW26376), val39Arg (AAW26377) or Gly9Arg plus val39Arg (AAW26377) mutations are specifically claimed. A cDNA clone encoding Rs-AFP2 preprotein can be modified by recombinant DNA methods to allow expression of mutant isoforms in yeast as mating factor alpha 1 fusion proteins. The Rs-AFP2 mutants have enhanced salt tolerant antifungal activity, especially when expressed in plant tissue where that may have curative as well as protective effects. They are useful for combating fungal diseases in agricultural, pharmaceutical or preservative applications This sequence represents an antifungal peptide. The invention relates to an antifungal composition comprising one or more antifungal agents and one or more food additives, providing that the composition dees not contain nicin or lactoferrin or a derivative, trichorziamine or lysozyme, the relative amounts of antifungal agent and food additive being such that they enhance the activity of the overall antifungal activity of the composition. Especially the antifungal agent is derived from a plant or Food additive synergistically enhances activity of an antifungal agent especially for prevent food and beverage spoilage. New active mutants of radish antifungal protein 2 - used to generate fungus-resistant plants or as therapeutic or preservative agents. 1 KLCERSSGTWSGVCGNNNACKNQCIRLEGAQHGSCNYVFPAHKCICYFPC 2 KLCQRPSGTWSGVCGNNNACKNQCIRLEKARHGSCNYVFPAHKCICYFPC Score 281, DB 2, Length 51, Pred. Synthetic AAY00737; Query Match Best Local S Matches RESULT 13 AAY00737 8 dd This protein sequence is the Rhapanus sativus (radish) mature antifungal protein (Rs-AFP2), which is homologous to proteins AAM19280. AAM19290. Shorter peptides, based on these proteins have been produced (see AAW19291-92, AAW19294-98, AAW19101-304, AAM19310-34 and AAW131765-834). Plants containing DNA sequences encoding these proteins have improved resistance to fungi. Compositions containing the peptides can be used to control fungi or bacteria in pharmaceutical (e.g. treatment of Candida infections) or preservative purposes (as food additives). In agriculture, they may also have curative as well as protective actions. The peptides to plants they may also have curative as well as protective actions. The peptides in croorganism capable of expressing the peptide into the soil. (Updated on 25-MAR-2003 to correct PI field.) ö Antifungal peptide derived from radish antifungal protein 2 - and related DNA, useful for producing plants with increased fungal resistance and as therapeutic or preservative agent. /note= "Val at position 39 may be replaced by a basic amino acid, preferably Arg"" Gaps /note= "Gly at position 9 may be replaced by a basic amino acid, preferably Arg"" Rs-AFP2; radish antifungal protein 2; fungicide; salt tolerance; preservative; transgenic plant; crop protection. . 0 1 KLCERSSGTWSGVCGNNNACKNQCIRLEGAQHGSCNYVFPAHKCICYFPC 50 /note= "Gly at position 16 may be replaced by hydrophobic amino acid, preferably Met" 39 /note= "Gln at position 5 may be replaced by hydrophobic amino acid, preferably Met"" 2 KLCQRPSGTWSGVCGNNNACKNQCIRLEKARHGSCNYVFPAHKCICYFPC 93.4%; Score 281; DB 2; Length 51; 92.0%; Pred. Defensins have antimicrobial properties. The specification describes a modified Cyscontaining antimicrobial peptide derived from a plant defensin. The peptide is modified by introducing one or more Cys residues and/or replacing or altering one or more Cys residues and/or form disulfide bridges. The antimicrobial peptide is useful in the treatment and prevention of microbial infections e.g. for combating fungal infection. It is useful for agricultural and pharmaceutical applications. It is also useful for agricultural and pharmaceutical fungi and is also useful in combating bacterial infections. A DNA sequence encoding the antimicrobial peptide is useful for producing transgenic plants with increased resistance to microbial pathogen, such that the plant is used as a parent in standard plant breeding crosses to develop hybrids and lines having improved fungal resistance
seed and the food additive is selected from an acid, salt or ester or a 1 dec alkyl ether or derivatives. The compositions are useful in preventing food spoilage e.g. in a wide range of foods and beverages including fruits, jams and dairy products, caused by the spoilage organisms fruits, jams and dairy products, caused by the spoilage organisms hastainum, Penicallium chrysogenum, P. roquefortli, P. nalgiovense, P. commune, Alternaria sp., Cladosporum sp., Tichoderma harzianum, Mucor plumbeus, Aspergillus versicolor and Scopulariopsis brevicaulis. The food additive and antifungal agent act synergistically to enhance the overall antifungal activity of the composition to a level above the sum of each single component
                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial peptide for combating bacterial infections, comprises modified cysteine residues, modified by addition, substitution or deletion to block their ability to form disulfide bridges.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fant F;

Van Amerongen A,

Novel antimicrobial proteins derived from plant defensin useful against a broad spectrum of microbes, comprise substitutions at specified portions of its sequence.

Disclosure; Page 6; 64pp; English

The present sequence is that of radish defensin protein Rs-AFP2. A claimed antimicrobial protein or peptide is derived from a plant defensin characterised by having 1 or more replacement amino acids, as indicated at positions 32, 34, 35, 36, 37, 38, 39, 40, 41 and/or 42 of the Rs-AFP2 sequence, provided that the replacement amino acids are not found raturally at these positions and the protein does not comprise only a replacement arginine at position 37, 39 or 42. In addition, cysteine replacement arginine at position 37, 39 or 42. In addition, cysteine replacement arginine at position 37, 39 or 42. In addition, cysteine replacement arginine at position 37, 39 or 42. In addition, cysteine replacement arginine at position 37, 39 or 42. In addition, cysteine replacement arginine at position 37, 39 or 42. In addition, cysteine replacement by a lapha-aminobutyric acid. The antimicrobial protein or peptide can be used on its cown, or in syneatistic combination with a plant defensin, to combat fungi. A plant having improved resistance to a fungal or microbial pathogen can contain recombinant DNA which expresses a clamed antimicrobial protein or peptide. The claimed antimicrobial protein or peptide is also used as a pharmaceutical to treat or prevent a microbial infection, especially a fungal infection (all claimed)

                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 71,

Cispecies: Arabidopsis thaliana (mouse-ear cress)
Cispecies: Arabidopsis thaliana (mouse-ear cress)
Cispecies: Arabidopsis thaliana (mouse-ear cress)
Cispecies: 24-Mar-1399 #sequence_revision 24-Mar-1999 #text_change 16-Feb-2001
Cispecies: D84655
Ricoursley, S.D.; Kanl, S.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, S submitted to the EMBL Data Library, August 1998
A; Pescription: Arabidopsis thaliana chromosome II BAC T19L18 genomic sequence.
A; Recession: T02622
A; Status: translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-60 cROUS
A; Cross-references: EMBL:AC004747; NID:g3413696; PID:g3413711
A; Experimental source cultivar Columbia
A; Experimental source cultivar Columbia
A; Experimental source cultivar Columbia

defensin AMPI - Clitoria ternatea

MyAlternate names: seed antifungal protein

C;Species: Clitoria ternatea

R;Osborn, R.W.; de Samblanx, G.W.; Thevissen, K.; Goderis, I.; Torrekens, S.; van Leuven, RsESS Lett. 368, 257-262, 1995

Submitted (MAY-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Possesses antifungal activity sensitive to inorganic
cations (By similarity).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the plant defensin family.

STRAIN-CV. Ronde Rode Kleine Witpunt; TISSUE-Seed;
Terras F.R.G., Goderis I.J., Penninckx I.J., Osborn R.W.,
Broekaert W.F.;
Submitted (APR-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Possesses antifungal activity sensitive to inorganic cations (By similarity).
-!- FUNCTLUIAR LOCATION: Secreted.
-!- SUBCELLUIAR Belongs to the plant defensin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31 KLCERSSGTWSGVCGNNNACKNQCINLEGARHGSCNYIFPYHRCICYFPC

cations.
--- SUBUNIT: Forms oligomers in its native state.
--- MASS SPECTROMETRY: MW=5705; MW ERR=0.8; METHOD=Electrospray.
--- SIMILARITY: Belongs to the plant defensin family.

Cammue B.P.A., Broekeart W.F.;

W. Vanderleyden J., Cammue B.P.A., Broekeart W.F.;

The new family of basic cysteine-rich plant antifungal proteins from Brassicaceae species.';

E. FEBS. Lett. 316:233-240(1993).

- I- FEBS. Lett. 316:233-240(1993).

- I- FUNCTION: Possesses some antifungal activity sensitive to inorganic cations and antibacterial activity against B.megaterium.

- I- SUMINIT: Perms oligomers in its native state.

- I- SIMILARITY: Belongs to the plant defensin family.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This cDNA represents the sequence of Rs-AFP2 from Raphanus sativus. PCR primer AAQ38640 was used together with AAQ38641 to generate a probe for screening a Raphanus sativus seed cDNA library. This primer corresponds to amino acids 2 to 7 of Rs-AFP1 and has a sense orientation. The 144bp product was partially re-amplified using AAQ38642 and AAQ38641 to give a 123bp product, which was further reamplified with the same primers and digoxigenin-11-dUTP instead of further reamplified with the same primers and plaque hybridisation. Positive plaques were purified and subjected to two plaque hybridisation. Positive plaques were purified and subjected to two additional screening rounds with the same probe. Inserts were excised in vivo into the pBluescript phagemid form with the aid of helper phage R408.Inserts from 2 positive places were excised by Bcorl digstion and insert sizes of approx. 400bp the others between 250-300bp. The inserts of the 4 largest clones were then sequenced and found to differ only in the length of their S' and 3' UTR's. The longest sequence was identified as Rs-AFP1 so the Rs-AFP2 was seen to differ by only 2 amino acids from Rs-AFP1 so the Rs-AFP2 was seen to differ by only 2 amino acids incleotide sequence by PCR assisted site directed mutagenesis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                        Biocidal proteins isolated from seeds of plants - e.g. brassica or dahlia, useful for increasing plants' resistance to fungal and bacterial

Raphanus sativus.

```
Plant-derived antimicrobial proteins are expressed in endosymbiotic Clavibacter xyli subsp. cynodontis (Cxc). Plants or seeds treated with recombinant Cxc are protected against fungal disease. A suitable antimicrobial protein is Rs-AFP1 from R. sativus. The full-length cDNA sequence of PCR assisted site-directed mutagenesis of Rs-AFP2 is given in AAQ70130 and the deduced amino acid sequence in AAR57327. (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            133 AAGTIGIGCCAAAGCCCAAGIGGGACAIGGICAGGAGTCTGIGGAAACAAAAACGCAIGC 192

Antimicrobial protein; AMP1; transgenic plant; linker propeptide;
protein expression; plant defensin; RSAFP2; antifungal protein; AFP2; ss
                  Isolated DNA from Raphanus sativus used to transform a microbe and a plant to produce an antibacterial protein used to increase resistance of rice paddy against pathogenic microbes.
                                                                                                          The present sequence encodes an antibacterial protein, designated radishin, isolated from Raphanus sativus (radish). A phage or plasmid comprising radishin can be used for increasing resistance of paddy and rice blast disease against pathogenic microbes
                                                                                                                                                                                                                                                                                                                                                                                     21 LysAsnGlnCysIleArgLeuGluGlyAlaGlnHisGlySerCysAsnTyrValPhePro

                                                                                                                                                                                                                       This sequence is the product of the amplification of the 5' region of the antifungal polypeptide AlyAFP, isolated from plants of the genus Alyssum, by a 5' RACE (Rapid Amplification of cDNA Ends) using primers AAF94575-T94576). The AlyAFP polypeptide can be used to control phytopathogenic fungi, whilst the coding DNA can be used to produce transgenic plants that express the polypeptide making them resistant to the phytopathogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        218

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMPP) I and the antifungal protein (AMPP). Inked by a linker propertied of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is post-translationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dipeptidic and one basic residue as a cleavable linker sequence
                                                                                                                    Improving expression of polyproteins in plants involves coexpression of two or more proteins in plants within a single transcription unit.

Portion of pFAJ3106 encoding Dahlia merckii antimicrobial protein.

Antimicrobial protein; DmAMP; transgenic plant; microbial infection; bacteria; fungi; field crop; fruit; vegetable; canola; banana; sunflower; apple; plant transformation vector; ds.

Dahlia merckii. Synthetic.

Location/Qualifiers 76. .525 /*tag= a /product= "Antimicrobial protein"

WO200011196-A1

The present sequence corresponds to the region between XhoI and SacI sites of plant transformation vector pFAJ3106, which encompass the coding region for Dahlia merckii antimicrobial protein, Dm-AMPI. The vector is useful in the production of transgenic plants which show improved resistance to infections by microorganisms such as bacteria and fungi. Transgenic plants include e.g. field crops, fruits and vegetables, such as canola, sunflower, tomato, apple, banana, pear and mango ||||||||||:::||| 373 AAGTIGTGCCCAAAGGCCAAGTGGGACATGGTCAGGAGTCTGTGGAAACAATAACGCATGC 432 433 AAGAATCAGTGCATTAGACTTGAGAAAGCACGACATGGGATCTTGCAACTATGTCTTCCCA 492 21 LysAsnGlnCysIleArgLeuGluGlyAlaGlnHisGlySerCysAsnTyrValPhePro 40 Antimicrobial protein; AMP1; transgenic plant; linker propeptide; protein expression; plant defensin; RsAFP2; antifungal protein; AFP2; ss. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dipeptidic sequences consisting of either two acidic, two basic or one acidic and one basic residue as a cleavable linker sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LysLeuCysGluArgSerSerGlyThrTrpSerGlyValCysGlyAsnAsnAlaCys 20

The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein properties of the plant defensins, the Dahlia antimicrobial protein properties of the invention. The specification describes methods for the invention. The specification describes methods for expense of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region. The method is used to produce proteins in plants. The linker propeptide comprising a cleavage site, whereby the expressed polyprotein is posttranslationally processed into the component protein molecules. The propeptide sequence is rich in amino acids A, V, S and T and contains dispeptide; sequences consisting of either two addict, two basic or one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            432
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial protein; AMP1; transgenic plant; linker propeptide;

A disease-resistant plant in which wasabi gamma-thionin gene is introduced, creation of the disease-resistant plant,

Claim 3; Page 8; 11pp; Japanese.

The present invention describes a disease-resistant plant in which a wasabi gamma-thionin gene is introduced. Also described is a method for the creation of the above disease-resistant plant by introducing a wasabi gamma-thionin gene to a plant. The present sequence encodes a Eutrema wasabi (Wasabia japonica) gamma-thionin protein from the present invention

41 AlaHis 493 GCTCA 326 standa 326; L-2000 (f ncoding a icrobial r in expressetic. a merckii. ntified. ntified. 11175-Al. R-2000. G-1999; G-1999; C-1998;	(ZENE) ZENECA LTD. Broekaert WF, Francois IEJA, De Bolle MFC, Evans IJ, Ray JA; WPI; 2000-246564/21. P-PSDB; AAY84059.	Improving expression of polyproteins in plants involves coexpression of two or more proteins in plants within a single transcription unit. Example 2, Fig 11; 151pp; English. The present sequence encodes a protein of the invention, comprising the mature proteins of the plant defensins, the Dahlia antimicrobial protein (AMP) I and the antifungal protein 2 (AFP2), linked by a linker propeptide of the invention. The specification describes methods for improving expression levels of one or more proteins in a transgenic plant. The method comprises inserting a DNA sequence having a promoter region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region operably linked to two or more protein encoding regions separated by a DNA sequence coding for a linker propeptide and a terminator region comprising a cleavage site, whereby the expressed polyprotein is post-translationally processed into the component protein molecules. The translationally processed into the component protein molecules. The propeptide sequences consisting of either two acidic, two basic or one acidic, and one basic residue as a cleavable linker sequence
